## SPECIFICATION

### Flora reservoir

- 5 The present invention relates to the provision of an artificial reservoir of water as a method of assisting plants shrubs flowers vegetables trees and the like to grow during a period of dry weather.

- The invention is shown by reference to the accompanying drawing in which a is a plant shrub flower vegetable tree or the like planted in the soil b so that the roots d are above a purpose designed bowl or reservoir c made of plastic metal or pottery and which is so positioned and of such size to catch and  
15 keep any water which may percolate into it and from which the roots d may take moisture during the drought or dry period. Thus if there is a natural fall of rain or the soil surface is irrigated some water will collect in this reservoir beneath the roots instead of  
20 draining away to waste.

### CLAIM

- What I claim in this application is a flora reservoir made from impervious material and having a perforated lid or top the whole reservoir being buried in  
25 the soil under a plant flower vegetable tree or the like flora to retain water and provide the flora with such water in times of drought the water being taken to the flora by the growth of the roots of the flora into the reservoir through the perforated lid or top of the  
30 reservoir and through this perforated lid or top the replenishment of the water in the reservoir is made by natural rainfall or by artificial means.
